

Thank you for considering
the Mobilize Study.

What is CIDP?

CIDP is an autoimmune disease that affects the nerves. Symptoms of CIDP may include:

- Tingling or loss of feeling in your arms and legs (can't feel a pin prick).
- Weakness in your arms and legs.
- Loss of reflexes, balance, and/or the ability to walk.

What is the purpose of this study?

We want to understand whether the study medicine can improve the symptoms of CIDP and their impact on daily activities.

Research studies help to improve the way doctors treat and prevent illness. This brochure explains a research study being done to learn more about a potential new treatment for CIDP.

Being in a study is completely voluntary. If you decide to join the study and then change your mind, you can leave at any time. Although your condition may or may not improve during the study, you would be helping to find better ways to treat this challenging condition.

If you are interested in learning more, please contact us. We are happy to answer any questions you have.

Who can join the study?

You may be able to join the study if you meet these and other criteria:

- Are at least 18 years of age
- Have been diagnosed with CIDP
- Have symptoms that have not improved after immunoglobulin or steroid treatment

Participating in a research study may not only change your personal journey, but may also help patients in the future.

Sanofi EFC17236 CIDP - Mobilize - Trifold -
10-OCT-2024 - English (Principal) - V2.0

[EFC17236-TF-V2-EnP]

A research study for people with chronic inflammatory demyelinating polyneuropathy (CIDP)

What happens during the study?

The study lasts about 2 years and has 4 parts.

Screening

1 visit

You'll have health checks and tests to **see if you qualify** for the study.

Treatment Part A

At least 5 clinic visits over 24 weeks

You'll take the **study medicine OR placebo** and visit the study clinic. The study staff will call you between clinic visits.

Treatment Part B

At least 4 clinic visits over 24 weeks

You'll take the **study medicine (NO placebo)** and visit the study clinic. The study staff will call you between clinic visits.

Follow-up

At least 1 visit and phone calls

You'll have a **final checkup** after you stop taking the study medicine. The study staff will also check on you by phone.

What is the study treatment?

Your study treatment could be the study medicine or a placebo. Neither you nor the study doctor and staff will know which one you are getting.

Study medicine

Not currently approved by your country's health agency for treating CIDP but can be used for research purposes

Placebo

Looks just like the study medicine but contains no active ingredients, which helps researchers understand the true effects of the study medicine

The study medicine blocks a protein in the blood that is believed to attack the body's normal cells and contribute to the development of diseases like CIDP.

The study treatment is a weekly injection. After receiving the first dose intravenously (into a vein) at the study clinic, you will come back to the clinic a week later to receive the first subcutaneous (under the skin) injection. During that visit you will be trained on how to inject yourself at home.

What kinds of procedures can I expect?

At study visits, there will be health checks and tests to monitor your health and for research purposes. You will not have every test at each visit.

Informed consent

Health and medicine review

Vaccinations (if applicable)

Blood samples

Urine sample

Pregnancy test (if applicable)

Vital signs (blood pressure and temperature)

Physical and neurological exams

Electrocardiogram heart test

Disease and health questionnaires

Study diary collection

What else should I know?

Before any study procedures can begin, you first need to agree to join the study by reading and signing the Informed Consent Form.

If you qualify for the study, you will receive study-related treatment, tests, and doctor visits at no cost to you.
